

Capacitive Proximity Sensors

DETECTION OF METALLIC AND NON-METALLIC OBJECTS

SICK
Sensor Intelligence.

Detection of metallic and non-metallic objects

When you need to know what is hidden behind a surface – a wall, a storage container, shipping container, or behind a cover capacitive proximity sensors are the solution. From solid materials like paper or wood, to granulates or liquids, the status of the product can be reliably detected during the production process and on final inspection. Is there something behind that cover? Is the filled package really full? How much paint is still left in the tank? For capacitive sensors, these are easy questions to answer.

SICK's capacitive sensors are never far from the action. Sensing ranges up to 25 mm allow them to be used in nearly all installation situations, making them extremely adaptable for a wide range of applications. These sensors are also remarkably resistant to malfunctions. Impurities, contamination, dust, and airborne spray particles have little effect on them, nor does electromagnetic interference. No wonder they are installed in a wide range of industries, such as food, automotive or in handling and warehousing systems.

Applications where capacitive sensors bring big advantages

- Detection of objects in dusty environments
- Detection of aggressive, contaminated media through plastic walls
- Detection of high light-absorbent objects such as wafers
- Detection of shiny or reflective objects such as glass or mirrors
- Detection of objects through packages

Detection all the way through the material

Wall thicknesses from 10 to 20 mm in the case of plastic or glass containers.

Tough/rough ambient conditions

Highly resistant to vibrations, dust, dirt, etc.

Detection of (nearly) all materials

Wood, paper, metal, plastic, liquids, granules.

Relatively large sensing ranges with a compact design

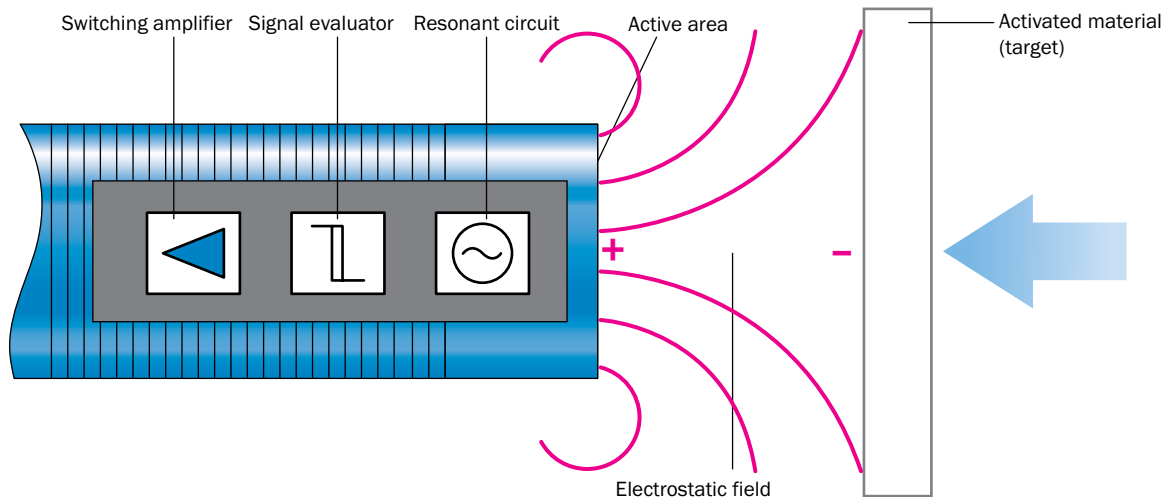

Up to 25 mm S_n , CM30 and CQ35.

High electromagnetic and electrostatic compatibility

Thanks to Triplshield technology.

The function of the capacitive proximity sensor is based on the change of the electric field in front of its sensor electrode (active zone). The sensor operates with an RC oscillator circuit. It is the capacitance between the active electrode and the ground electric potential which is measured. Approaches a metallic or non-metallic material the active zone of the sensor the capacitance increases and thus influences the amplitude of the RC oscillator. The signal evaluator detects this change in amplitude and the switching amplifier signals to switch. The sensitivity of the sensor can be adjusted via a potentiometer or Teach-in-button.

Capacitance can be described using the following formula:

$$C = \epsilon_r * A/d$$

ϵ_r = dielectric permittivity (dielectric constant)

A = electrode area (active zone)

$1/d$ = distance between electrodes

The greater ϵ_r , the greater the A or the smaller the d, the greater the change in capacitance, and the easier an object will be to detect. Grounding increases the operating distance and thus the reliability of detection.

Calculating the assured operating distance:

$$S_a = S_n (\text{min}) \times 0,72 \times K_w$$

Material	Dielectric permittivity ϵ_r	Material correction factor (K_w)
Metal	80	1.00
Water	80	1.00
Alcohol	30	0.70
Glass	8	0.60
Ceramic	7	0.50
PVC	6	0.40
Ice	5	0.35
Oil	2	0.25
Air (vacuum)	1	0.00

Feature	Advantage	Benefit
Tripleshield technology	Outstanding protection against electrostatic discharge, electromagnetic radiation and surge voltage interference	High machine availability thanks to fail-safe sensors
Potentiometer or teach-in function	Easy adjustment of operating distances	Fast commissioning to ensure correct detection
Programmable output function	Choice of normally open or normally closed functionality	Minimal storage, resulting in cost savings
Completely enclosed	Highly resistant to vibrations and shocks	Process reliability even in extremely tough environments

Tip 1

Grounded and conductive targets provide maximum detection reliability and operating distances.

Tip 2

If the sensors sensitivity is adjusted too high (maximum seating) the sensor can hang-up (is not switching off). So the sensitivity has to be reduced.

Tip 3

A capacitive sensor detects through non-metallic walls. This if the electrical permittivity of the object/medium behind the wall is higher than the electrical permittivity of the wall.

Tip 4

The detection is mainly influenced by the distance between the active zone of the sensor and the object/medium, the size of the active zone and the electrical permittivity of the object/medium.

SICK AT A GLANCE

SICK is a leading manufacturer of intelligent sensors and sensor solutions for factory, logistics, and process automation. With more than 6,000 employees and over 40 subsidiaries worldwide, we are always close to our customers. A unique range of products and services creates the perfect basis for controlling processes securely and efficiently, protecting individuals from accidents and preventing damage to the environment.

We have extensive experience in various industries and understand their processes and requirements. With intelligent sensors, we can deliver exactly what our customers need. In application centers in Europe, Asia and North America, system solutions are tested and optimized in accordance with customer specifications. All this makes us a reliable supplier and development partner.

Comprehensive services round out our offering: SICK LifeTime Services provide support throughout the machine life cycle and ensure safety and productivity.

For us, that is “Sensor Intelligence.”

Worldwide presence:

Australia, Austria, Belgium/Luxembourg, Brazil, Czech Republic, Canada, China, Denmark, Finland, France, Germany, Great Britain, Hungary, India, Israel, Italy, Japan, Mexico, Netherlands, Norway, Poland, Romania, Russia, Singapore, Slovenia, South Africa, South Korea, Spain, Sweden, Switzerland, Taiwan, Turkey, United Arab Emirates, USA

Please find detailed addresses and additional representatives and agencies in all major industrial nations at: www.sick.com
