

The LBV300 universal limit switch for bulk materials – rugged and reliable measurement for bulk materials using the tuning fork principle

variant with suspension cable and the tube-extended LBV330 sensor for vertical mounting in silos are used with switching distances of up to 80 meters (LBV320) or 6 meters (LBV330). With a wide variety of thread and flange connections, and several electronic variants, the LBV300 series offers a solution for almost all applications, even in potentially explosive atmospheres. As a result of the flexibility of the device design, the LBV300 can also be used, in particular, for retrofit projects – as a replacement for outmoded technologies such as rotating paddle sensors.

Advantages

- Rugged device design
- Flexible basic concept allows customer-specific solutions
- Teaching without filling
- Very high reproducibility

The level sensors of the LBV300 series fulfil their tasks signalling full, empty, or desired states ruggedly, reliably and highly accurately. The measurement principle of the tuning fork reacts to changes in density between the surrounding air and the bulk material, and thus operates independently of silo shape, the tank material used, container structures or the bulk material involved. It is also friction-free and maintenance-free.

Area of use

The devices of the LBV300 series are used in tanks and silos, as well as storage and intermediate containers for bulk materials. While the LBV310 basis device is principally used to signal full states or mounted laterally for demand or empty states, the LBV320

Fault monitoring

The electronics module continuously monitors the correct vibrating frequency and the line break to the piezo drive.

If one of the stated malfunctions is detected or in case of power failure, the electronics takes one defined switching condition, e.g. the relay deenergises (safe condition).

Electrical connection

1 Preparing the connection

Please note safety instructions

Always keep in mind the following safety instructions:

- Connect only in the complete absence of line voltage

Take note of safety instructions for Ex applications

Ex In hazardous areas you should take note of the appropriate regulations, conformity and type approval certificates of the sensors and power supply units.

Ex In hazardous areas, only use approved cable connections for LBV series.

Select connection cable for Ex applications

Ex Take note of the corresponding installation regulations for Ex applications.

2. Wiring plan

Relay output

We recommend connecting LBV300 in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The relays are always shown in non-operative condition.

LBV300

1 Relay output

2 Relay output

3 Voltage supply

Transistor output

We recommend connecting LBV300 in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The instrument is used to control relays, contactors, magnet valves, warning lights, horns as well as PLC inputs.

1 Voltage supply

Contactless electronic switch

We recommend connecting LBV300 in such a way that the switching circuit is open when there is a level signal, line break or failure (safe condition).

The contactless electronic switch is always shown in non-operative condition.

The instrument is used for direct control of relays, contactors, magnet valves, warning lights, horns etc. It must not be operated without an intermediately connected load, because the electronics would be destroyed if connected directly to the mains.

It is not suitable for connection to low voltage PLC inputs. Domestic current is temporarily lowered below 1mA after switching off the load so that contactors, whose holding current is lower than the constant domestic current of the electronics, are reliably switched off.

1 Shielding

NAMUR output

For connection of the amplifier according to NAMUR (IEC 60947-5-6, EN 50227). You can find further information in the „Technical data“.

Mounting instructions

Switching point

In general, LBV300 can be installed in any position. The instrument only has to be mounted in such a way that the vibrating element is at the height of the desired switching point.

The only exception is vertical mounting of the tuning fork from below. In this position there is the danger of solid particles getting stuck between the fork tines.

Socket

The vibrating element should protrude into the vessel to avoid build-up. For that reason, avoid using mounting bosses for flanges and screwed fittings. This applies particularly to horizontal installation and use with adhesive products.

Filling opening

Install the instrument in such a way that the vibrating element does not protrude directly into the filling stream. Should such an installation location be necessary, mount a suitable baffle above or in front of the vibrating element, e.g. L80 x 8 DIN 1028 (see Fig. Part „a.“). In abrasive solids, mounting according to fig. Part „b.“ has proven to be a good solution. The mound that forms in the concave baffle protects it from abrasion.

a. Convex mounting
b. Concave mounting

Inflowing medium

If LBV300 is mounted in the filling stream, unwanted false measurement signals can be generated. For this reason, mount LBV300 at a position in the vessel where no disturbances, e.g. from filling openings, agitators, etc., can occur.

Horizontal mounting

To achieve a very precise switching point, you can install LBV300 horizontally. However, if the switching point can have a tolerance of a few centimeters, we recommend mounting LBV300 approx. 20° inclined to the vessel bottom to avoid build-up.

Orient the tuning fork of LBV300 so that the product cannot remain lying on the fork surface. There is a mark on the thread hexagon for aligning the fork. Make sure that the mark points upward.

Material cone

To achieve a very precise switching point, you can install LBV300 horizontally. However, if the switching point can have a tolerance of a few centimeters, we recommend mounting LBV300 approx. 20° inclined to the vessel bottom to avoid build-up.

Orient the tuning fork of LBV300 so that the product cannot remain lying on the fork surface. There is a mark on the thread hexagon for aligning the fork. Make sure that the mark points upward.

To compensate measurement errors caused by the material cone in cylindrical vessels, the sensor must be mounted at a distance of $d/6$ from the vessel wall.

1 LBV320
2 Emptying opening
3 Filling opening

Tensile load

With cable version, make sure that the max. permissible tensile load on the suspension cable is not exceeded. The danger of this happening exists particularly with very heavy solids and large meas. lengths. The max. permissible load is stated in chapter „Technical data“.

Agitators

Due to filling or extraction forces, vibrations or similar, the level switch can be subjected to strong lateral forces. For this reason, do not use an overly long extension tube for LBV330, but check if a LBV310 level switch couldn't be used instead, mounted on the side of the vessel in horizontal position.

Extreme vibration caused by the process or the equipment, e.g. by fluidization or beaters in the vessel, can cause the extension tube of LBV300 to vibrate in resonance. This leads to increased stress on the upper weld joint. Should a longer tube version be necessary, you can provide a suitable support or guy directly above the vibrating element to secure the extension tube.

This measure applies mainly to applications in Ex areas. Make sure that the tube is not subject to bending stress due to this measure.

If an installation from above is necessary, check if you can use a cable version. Over a longer period of time, strong vibration can damage the instrument electronics. You can decouple the electronics from the process by using a remote (displaced) housing.

Flows

To make sure the tuning fork of LBV300 generates as little resistance as possible to product flow, mount the sensor so that the surfaces are parallel to the product movement.

Flow orientation of the tuning fork

1 Marking with screwed version

2 Direction of flow

Operation

Adjustment elements electronics module e.g. relay output

- 1 Potentiometer for switching point adaptation
- 2 DIL switch for mode adjustment
- 3 Ground terminal
- 4 Connection terminals
- 5 LED display

Switching point adaptation (1)

The LBV300 is preset to a product density of $> 0.02 \text{ g/cm}^3$ (0.0007 lbs/in^3). In very light solids, turn the potentiometer to complete left position $0.008 \dots 0.1 \text{ g/cm}^3$ ($0.0003 \dots 0.0036 \text{ lbs/in}^3$). By doing this, the tuning fork will be more sensitive and can detect very light solids, such as e. g. Aerosils more reliably.

Mode adjustment (2)

With the mode adjustment (min./max.) you can change the switching condition of the output. You can set the required mode (max. - max. detection or overflow protection, min. - min. detection or dry run protection).

LED display (5)

Light-emitting diode for indication of the switching status.

Simulationkey (only with NAMUR electronics)

The simulation key of the NAMUR electronics is lowered on the upper side of the electronics module. Push the simulation key with a suitable object (screwdriver, pen, etc.).

When the key is pushed, a line break between sensor and processing unit is simulated. The signal lamp on the sensor extinguishes.

The measuring system must signal a fault and take on a safe condition when the key is pushed. Keep in mind that downstream connected instruments will be activated during operation. This allows you to check the correct function of the measuring system.
